

Upgrade to modern Mode 5 capability without redesigning your platform.

The KIV-79 to KIV-77 Adapter allows the KIV-79 cryptographic unit to operate as a form-fit replacement for legacy KIV-77 installations—preserving footprint, connector alignment, and mounting interfaces. This adapter streamlines integration and testing, providing a plug-and-play path for upgrading existing transponder or interrogator systems to current NSA-approved Mode 5 encryption standards.

Compatible with the KIV-79 Emulator, the adapter supports seamless integration with a range of Mode 5 test environments, including the **Tel-Instrument T-47/M5** and **TS-4530A Test Sets.**

This versatility makes it ideal for both field verification and lab-based IFF development and validation.
